

Sri Sai Sarath Chandra Konuru

Senior Software Engineer

Jersey City, NJ (Open to Onsite)

konurusarath@gmail.com 1-908-726-3990 linkedin.com/in/konurusarath github.com/skonuru8

SUMMARY

- Full-stack engineer with 6+ years owning backend systems across **Java, Node.js, and Python**, architecting cloud-native microservices across **telecom, healthcare, and automotive** domains.
- Led service decomposition that restored contract processing from **7 minutes to 1 minute**, driving an **85% reduction** in processing time and eliminating deployment bottlenecks.
- Deep expertise in **Azure** (Service Bus, Cosmos DB) and **AWS** (Kinesis, SQS, Lambda), designing event-driven and serverless architectures for high-throughput pipelines.
- Designed and optimized data persistence layers across **Azure Cosmos DB, Redis, DynamoDB, and SQL Server**, implementing caching strategies and query optimizations that cut latency by up to **55%**.
- Strong frontend background in **Angular, React, and Flutter**, delivering enterprise dashboards and multi-platform mobile applications across multiple domains.
- Managed **CI/CD pipelines** across Jenkins and GitLab spanning **10+ microservices** at Nokia, a monolithic Spring Boot + Angular stack at PHIA, and a Node.js + Flutter setup at AquilaEdge, achieving **95%** deployment success.
- Strengthened enterprise security posture by integrating **Keycloak** for SSO and fine-grained **RBAC**, reducing login-related support tickets and ensuring compliance across healthcare workflows.
- Mentored and onboarded **5+ engineers** on CPQ architecture and microservices workflows, accelerating ramp-up time and raising overall team code quality.
- Recognized alongside the lead architect with a **Nokia Business Appreciation Award** for end-to-end technical ownership across **10+ microservices**.
- Holds an **M.S. in Computer Science** from Stevens Institute of Technology, with advanced expertise in scalable system design and ML architecture.

SKILLS

Programming Languages: Java, Javascript, Typescript, Python, C, Golang

Backend: Node.js, Spring Boot, Spring Cloud, Spring MVC, Microservices, REST APIs, GraphQL, Fast API, Camunda BPMN, Hibernate/JPA, Drools

Frontend: Angular, RxJS, ReactJS, Redux, Flutter, HTML, CSS, Bootstrap

Messaging & Streaming: Apache Kafka, RabbitMQ, Azure Service Bus, JMS, AWS SQS

Cloud & DevOps: Microsoft Azure(Pipelines, Artifacts, Microsoft Entra ID), AWS (S3, EC2, Lambda), GCP (Compute Engine, Cloud Storage, Cloud SQL, VPC), Docker, Jenkins, Gitlab CI/CD

Databases:SQL Server, Azure Cosmos DB, Oracle, PostgreSQL, Redis, DynamoDB, pgvector

API and Integration: REST, GraphQL, OpenAPI/Swagger, Apigee, API Gateway, JSON, XML

Security: OAuth2, JWT, SSO, LDAP, MFA, Spring Security, Keycloak

Testing Tools: JUnit, Mockito, SonarQube, Mocha, Jasmine, Karma, Vitest

Monitoring and Logging: Azure Monitor, Slf4j, Winston

Build Tools and Version Control: Maven, Gradle, Npm, Git, Bitbucket, VS Code Extension API

Development Methodologies: Agile(Scrum), TDD, SDLC

EXPERIENCE

AquilaEdge LLC

January 2025 - June 2025, Remote

Full-Stack Engineer

- Served as the **sole engineer** on **DaxP**, a multi-platform healthcare application supporting **patient, doctor, pharmacy, and admin** roles, working directly with founders on architecture and end-to-end delivery.
- Developed **Flutter** screens across **Mac, Android, and Web** platforms, contributing to a near-fully functional app featuring vaccination appointment booking, vaccination history, and pharmacy and prescription management.
- Designed and built **Node.js REST APIs** serving all four user role types, backed by **Google Cloud SQL** on **GCP**, forming the core data layer of the platform.
- Implemented **JWT-based authentication and authorization** across all user roles, ensuring secure, role-specific access control on a healthcare platform handling sensitive patient data.
- Provisioned and configured **Windows Server VMs** on GCP, deploying the Flutter web app and Node.js backend services, establishing the entire infrastructure from scratch.
- Set up a **self-hosted GitLab Runner** and authored **CI/CD pipelines** that build, test, and zero-touch deploy both the **Flutter** and **Node.js** apps to their respective **GCP VMs**.

Hitachi Vantara

July 2019 - August 2024, Hyderabad, Telangana, India

Sr. Software Engineer (April 2024 - August 2024) | Consultant (July 2019 - March 2024)

- Promoted to **Senior Software Engineer** in recognition of sustained technical contributions and cross-service ownership across the **Nokia CPQ** platform, continuing full-stack delivery on **Azure**-based microservices.

Project: Nokia

- Architected and built the **Contract Case Spring Boot microservice** from scratch - the most business-critical component of **Nokia CPQ** - converting telecom sales offers into contractual quotes and serving as the backbone of the entire quote-to-cash pipeline.
- Proactively identified tight coupling risks in the growing Contract Case service and partnered with architects to decompose it into three focused microservices, restoring processing time from **7 min to <1 min** and eliminating deployment bottlenecks.
- Operated as one of the **few engineers outside the lead/architect group** on a **50-person, 4-team project** with cross-service visibility and contributions across **10+ Spring Boot microservices**, spanning Azure Service Bus integrations, REST APIs, and Cosmos DB data flows.
- Collaborated on and implemented a **cache-first CRM integration pattern** across services, making upstream API calls only on cache misses and storing results locally, significantly reducing redundant external calls and improving system responsiveness.
- Drove a **55% API latency reduction (11s to under 5s)** by implementing **Redis caching** with careful memory overhead management and optimizing **Cosmos DB** queries, directly accelerating contract creation for the sales team.
- Co-developed an **Excel ingestion service** that auto-generates complete sales flows across the **Opportunity through Order Orchestration** pipeline, saving operations teams several hours of manual data entry daily.
- Implemented an overnight **Spring Quartz scheduler** that automatically refreshes daily FX rates and recalculates prices across all active contracts and quotes, eliminating manual updates.
- Won a **project-wide bug-fixing contest** by resolving the highest number of defects with zero reopened issues, and completed **two UAT cycles** with zero reopened defects, earning direct recognition from the chief architect.
- Led a **sub-team of 2 engineers** on a new initiative, assigning tasks and providing technical guidance, and subsequently mentored and onboarded **5+ new engineers** across CPQ architecture and workflows, accelerating ramp-up and raising overall code quality.
- Gained hands-on exposure to **Docker, Kubernetes, and Azure Pipelines** through close collaboration with the DevOps team, deepening understanding of containerization and deployment orchestration in a large-scale Azure environment.
- Maintained code quality and coverage standards by writing **JUnit** and **Mockito** test cases, enforcing **SonarQube** rules across all contributed microservices to ensure clean, compliant, and production-ready code.

Project: PHIA

- Served as the **sole full-stack developer** on **PATS**, a healthcare appeals automation platform processing **ICE, PACE, and DICE** workflows for The PHIA Group, owning end-to-end delivery across backend, frontend, infrastructure, and client communications for **15+ months**.
- Acted as the **primary point of contact** for PHIA Group stakeholders, independently translating complex healthcare appeals requirements into technical solutions and delivering features consistently on time.
- Refactored and split **oversized Camunda BPMN workflows** across all three service lines into modular sub-processes, reducing average workflow execution time by **10%** and restoring SLA compliance across email-triggered appeals processing pipelines.
- Modernized **Angular** forms used for manual ticket creation, decoupling tightly coupled components across a monolithic architecture and resolving **30+ backlog issues**, reducing UI defect reports by **10%** over two release cycles.
- Built and configured **Keycloak** SSO with fine-grained **RBAC** from scratch, securing the platform with role-based access control and significantly reducing login-related support tickets.
- Wrote optimized **SQL Server** queries for client-facing task-listing reports, improving generation times by **15%** and enabling real-time queue visibility for PHIA Group clients.
- Owned and managed **Jenkins** CI/CD pipelines for both the monolithic **Spring Boot** backend and **Angular** frontend, achieving **95%** deployment success and eliminating manual rollback steps.
- Handled **production incidents solo**, diagnosing and resolving critical issues on a compliance-sensitive healthcare platform with no escalation path.
- Maintained code quality by writing **JUnit** tests across backend services and workflow integrations, ensuring reliability on a platform with zero tolerance for processing errors.

Project: Nissan

- Collaborated with **Nissan stakeholders** on both design and implementation of a unified vehicle telemetry ingestion platform, normalizing data arriving in **binary, XML, and non-standard JSON** formats from heterogeneous vehicle fleets into a single **canonical JSON schema**.
- Engineered format-specific transformation services using **Spring Boot** and **Drools** rules engine, centralizing conversion logic that was previously duplicated across isolated services and reducing processing time by **30%**.
- Built and maintained **Spring Boot** microservices with **Hibernate/JPA** persistence layer on **EC2**, enabling on-demand and real-time streaming of **100+ GB** of vehicle telemetry data into **DynamoDB** with high availability and low latency.
- Integrated **AWS Kinesis** for real-time stream processing and **S3** for raw data ingestion, ensuring reliable and fault-tolerant data flow across the entire telemetry pipeline.
- Designed serverless components using **AWS Lambda** and **API Gateway** for fleet metadata management and eligibility checks, reducing infrastructure overhead and operational complexity.
- Co-built a customer-facing dashboard portal using **Angular**, enabling fleet owners to monitor vehicle metrics and manage data-sharing preferences, improving self-service capabilities and reducing support overhead.

- Wrote **JUnit** unit tests across transformation, streaming, and persistence services, using **DynamoDB Local** for integration testing to validate data flows without dependency on live AWS infrastructure, ensuring reliability of business-critical workflows.

Persistent Systems

January 2019 - July 2019, Hyderabad, Telangana, India

Apprentice

- Supported the team in building **Python** + **OpenCV** preprocessing scripts for thousands of daily IRS form scans, helping cut our manual cleanup workload by about **30%**.
- Ran batches of preprocessed images through **Tesseract OCR**, logged common misreads, and assisted senior analysts in manually correcting errors-contributing to an overall data-accuracy rate above **95%**.
- Helped implement basic validation checks (format rules, checksum verifiers) and documented repeat OCR error patterns to guide improvements in our extraction pipeline.
- Contributed to form-type recognition by writing simple layout- and regex-based rules, which reduced the need for manual sorting of 1040s, W-2s, and 1099s.

PROJECTS

job-hunter

TypeScript, Node.js, Python, PostgreSQL, Redis, React

- Manually reviewing listings across **3 job boards** consumed over **3 hours daily** with inconsistent triage quality. Built a fully autonomous job intelligence pipeline that processes all sources simultaneously, eliminating manual discovery entirely and delivering verdict-ranked results with **zero human intervention** per run.
- Generic keyword matching surfaced low-fit roles and wasted application effort on positions that rarely converted. Designed a multi-signal semantic scoring engine combining skill matching, seniority inference, and AI-driven candidate-role alignment that reduced apply-queue noise by over **70%** and ensured only the highest-fit opportunities reached review.
- Writing a tailored resume and cover letter per application consumed **~20 minutes per role**. Implemented a dual-artifact generation engine that produces a job-specific resume and cover letter for every high-verdict opportunity calibrated against the extracted role structure, cutting per-application composition time to **under 2 minutes**.
- Pipeline verdicts existed only as raw files with no structured way to track or act on them. Shipped a **React** + **TypeScript** review UI with score-ranked apply queues, three-tier triage classification, and one-click application tracking that reduced candidate review time from **3+ hours** to **under 30 minutes daily**.

Privacy Guard

TypeScript, Node.js, VS Code Extension API, Anthropic, OpenAI

- Credential leaks and PII exposure routinely slipped through code review undetected, creating serious compliance risk before code reached version control. Built an **AI-powered VS Code extension** that intercepts every git commit and subjects staged diffs to a multi-layer privacy enforcement pipeline combining local static analysis and LLM-based contextual reasoning, eliminating an entire class of pre-commit violations across **3 regulatory frameworks**.
- Routing every commit diff to an external LLM introduced latency and drove up API costs across active development cycles. Engineered a local analysis engine that resolves violations without an external model call, reducing unnecessary LLM API calls by **60%** and cutting operational cost proportionally.
- Sending raw code diffs to AI providers risked exfiltrating the very credentials the tool was designed to catch. Wired **3 AI providers** as hot-swappable backends and built an outbound sanitizer that scrubs sensitive material before transmission, closing the self-exfiltration vector on **100%** of outbound payloads.
- Developers had no visibility into whether third-party packages violated **GDPR** or **CCPA**, leaving the dependency graph entirely unaudited. Delivered a supply-chain privacy scanner that maps every npm package to a risk profile and surfaces safer alternatives, extending enforcement coverage from source code to the **full dependency graph**.

EDUCATION

Masters of Science in Computer Science

Stevens Institute of Technology, Hoboken, New Jersey

January 2026

Bachelor of Technology in Computer Science

Mahatma Gandhi Institute of Technology, Gandipet, Hyderabad, Telangana

June 2019

AWARDS

Business Appreciation Award

Nokia, 2024

- Recognized alongside architect as one of only two team members for outstanding contributions to telecommunications sales system

Annual SPOT Award + Quarterly/Monthly Awards

Nokia, 2023

- Multiple recognition awards for exceptional technical contributions and project impact

Special Recognition Awards (3x)

Nokia, 2023

- Outstanding work and sheer commitment during UAT cycles
- Leadership excellence for mentoring team members on new initiatives
- Technical reliability and cross-system expertise recognition
